

TOWN OF NORTHFIELD
SOUTH GATEWAY CORRIDOR PLAN

Complete Streets Concept

SAFER STREETS. STRONGER
CONNECTIONS. HEALTHIER COMMUNITIES.

AUGUST 2026

Complete Streets Concept

Multimodal corridor concept focused on safety, access, green infrastructure, and place.

Prepared by Rachel S. Bailey, M.U.P. | September 2026

Portfolio work product for the fictional Town of Northfield, New York.

1. Corridor Design Objective

The Complete Streets concept rebalances the South Gateway so it functions as a safe transportation corridor and a welcoming neighborhood street.

Users

Design decisions consider pedestrians, cyclists, transit riders, drivers, people with disabilities, older adults, and families.

Context

Treatments vary by block and destination; the goal is a connected system rather than a single cross section.

2. Pedestrian & Bicycle Network

Continuous, comfortable facilities are central to the corridor concept.

Planning Topic	Key Finding / Direction
Pedestrians	Improve crossings, curb ramps, sidewalk continuity, lighting, and refuge where appropriate.
Cyclists	Provide a connected low-stress facility linking neighborhoods, downtown, and the greenway.
Intersections	Use shorter crossings, visibility improvements, and speed-management treatments.
Wayfinding	Clarify routes to the riverfront, downtown, civic destinations, and neighborhood services.

3. Transit, Green Infrastructure & Streetscape

Mobility improvements are paired with public-realm and environmental strategies.

Transit

Coordinate stop locations with safe crossings, accessible boarding areas, shelters, and pedestrian routes.

Green infrastructure

Use street trees, planting areas, and stormwater practices where feasible to improve comfort and resilience.

Streetscape

A consistent family of lighting, furnishings, planting, and signage can reinforce corridor identity.

4. Phasing & Performance

Implementation can begin with targeted safety improvements while larger capital projects advance.

Planning Topic	Key Finding / Direction
Near term	Striping, signs, crossing upgrades, maintenance, lighting, and tactical public-realm improvements.
Mid term	Intersection reconstruction, bicycle facilities, transit-stop improvements, and green infrastructure.
Long term	Major corridor reconstruction coordinated with redevelopment and utility work.
Measures	Track crashes, speeds, pedestrian comfort, bicycle connectivity, transit access, and public-realm use.

The Complete Streets concept supports mobility and economic vitality by making the corridor easier and safer to use while preserving its gateway function.
